**ABSTRACT**

This is the check list of the ground beetles (Coleoptera: Carabidae) captured in different localities in the Western Rhodope Mts. in the period 2014 – 2017. A total of 133 species were found, including 16 endemic (12% of all), 5 relicts and 10 new for the studied area species. Genera *Badister* and *Tachys* were reported for the first time from the Western Rhodopes. The faunistic contribution was made for a region researched in detail for the last in 2006. The results proved the predominantly mesophilous nature of the habitats due to the large percentage of forest territories. The life forms of the carabids showed the prevalence of the zoophages over the mixophytophages both in qualitative (67% : 33%) and in quantitative terms (85.5% : 14.5%).

**Key words:** new records, check list, Carabidae, Western Rhodope Mts., life forms, localities

**Appendix.** Systematic check list of the ground beetles found in the Western Rhodope Mts. HP – humidity preference; H – hygrophilous, MH – mesohygrophilous; M – mesophilous, MX – mesoxerophilous, X – xerophilous; LF – life form (explanations are given in the Material and Methods section of the main paper published in J. BioSci. Biotech. 2017, 6(3): 203-209); ♀ – female, ♂ – male, ex. – not determined); \* – new for the studied area species. Explanations about the localities and periods of sampling are also given in the main paper.
